

DS d'anglais n°1

1.

Scientists are trying to grow animals tissues in lab since a few years to allow the world population to have access to meat without destroying the environment in the future. According to this article, fruits might also need to be lab-grown in the future to allow everyone to access them as it takes up little space, we could only grow consumable tissues so we don't waste non-edible parts and we could produce them at the core of huge cities, which reduces carbon emissions caused by transportation. 2.

Climate change is a growing issue which we need to address. As we managed to go from only dreaming of flying to setting up a space station in only a century, that could lead us to think that technology will solve the climate crisis. On one side thanks to progress in nuclear and renewable energies electricity in France and Norway is almost carbon-free, and electric and hydrogen cars don't emit greenhouse effect gas compared to thermic cars. On the other huge air filters are developed in India to clean major cities where the atmosphere is so polluted that it becomes toxic to breathe, however you need to build the pumps to power those filters which requires rare metals that need to be extracted which pollutes a lot, and the same issue is faced with electric and hydrogen cars. To sum it up technology is a powerful tool that will help us face global warming but it can't do everything for us the same way a saw can't drill a screw hole. [170 mots]
